

# Adaptation to Climate Change

The impacts of climate change on our ways of life and organization constitute, and will continue to constitute, a major challenge of the 21st century. **Mitigation** and **adaptation** measures represent two key areas where research is being carried out and where public policy strategies are being developed.

Nationally structured frameworks<sup>1</sup> are being designed for these **adaptive measures** in order to limit the expected impacts of climate change, both on socio-economic activities and on species, natural environments, and ecosystems.

This training session aims to conduct an **initial quantitative analysis of the scientific literature published on adaptation issues**, by harvesting bibliographic records from the Web of Science and by leveraging the analytical capabilities developed by the Cortext platform and made available through CorText Manager.
